

Increasing the life of your anvil covers.

*Are you looking for more ways to save money every month?
What if we could save you money in a way you've never seen before?
AnvilPro will save you money by increasing the life of your anvil covers!*

Auto Relief Feature

The typical die-cutter has over 35% of no feed time while the machine is running. **When the operators stop feeding sheets, AnvilPro automatically relieves the die-cut pressure, saving unnecessary wear on the anvil covers.** When the operators start feeding sheets again, AnvilPro automatically sets the die-cut pressure to the cut position.

AnvilPro Touch Screen

AnvilPro doesn't allow operators to make foolish setup mistakes...

Using a new & revolutionary technology, AnvilPro automatically positions the die-cut pressure, preventing the operators from making the mistake of using excessive die-cut pressure and ruining the anvil covers prematurely.

Improving Setup Time

To setup an order, the operator simply presses a button and the die-cut pressure is automatically set to the cut position. Plus, when combined with Sunrise, the offset for each spec is saved and displayed the next time that spec is run, reducing waste.

Installation

AnvilPro is easy to install and calibrate. We use a variety of motors, depending on your machine.

Combine with Sunrise, our automatic setup system for die-cutters and save even more money!

ANVILPRO

JUSTIFICATION

AnvilPro will pay for itself in a year!

An increase of 35% in the life of your anvil covers could equal **BIG** savings.

Annual Savings = \$15,725

Monthly Savings = \$1310

Assumptions :

Set of anvil covers (\$1200); Time to rotate (20 minutes), Direct cost per hour (\$300), Increase in cover life (35%).

Without AnvilPro: Anvil cover replacements per month (2.4), Anvil cover rotations /month (6).

Other Savings

- Savings from utilizing automatic pressure adjustment, reducing inappropriate wear due to operator manual adjustment.
- Increased wood die life.
- Savings resulting from reduced setup time.

Payoff

In less than a year, AnvilPro will pay for itself!

Ask us for a quote for your machine and start saving money immediately!

HOW IT WORKS

- After the operator has mounted the wood die, he or she presses the "Cut Position" quick key.
- If sheets are not being fed, the die-cut pressure goes the relieved cut position. When the feed is turned on, the die-cut pressure goes to the cut position.
- The operator can adjust the pressure using the Up/Down arrow keys.
- Any time the feed is turned off during the order, die-cut pressure is automatically relieved until feed is turned back on.
- When it's time to rotate or change the anvil covers, the alarm message is displayed on the main screen.
